## 1. Introduction

This is an example to show the possibilities available with **Scriba** and JavaScript and how it integrates with **JSDoc** generated with the YUIDoc tool.

The sample application simply opens a page with a menu on top to load some of the modules it is made off. The sample application has been written using [Dojo](#) but is is just to have a "realistic" module structure to show properly the integration between **Scriba** and **JSDoc**.

The application has the following folder structure:

- *app*: to hold the "application" modules.
- *common*: to hold the "common" modules.
- *extra*: to hold the "extra" modules.

This is just some sample text and the real purpose is to look at it in conjunction with the sample application source code so you can see how the things defined on the code end up showing in

the generated document.

## 2. Sample Application Structure

This chapter gives a bit of an explanation on how the modules are organized. Note that the contents are generated from different files and the order they are in the files system does not actually matters as **Scriba** uses an order based on the section numbers defined.

### 2.1 Application

The [Application](#) class holds the main functionality of the application. In the [Application](#) we define the main HTML content and structure of the application. Please note that the class description is shared between **Scriba** and **JSDoc**.

The [Application.createIn](#) method will use the Dojo functions to put the HTML previously defined into the web browser DOM. After that it will create some click handlers on the application menu to execute actions when the menu options are selected.

### 2.2 Common Modules

These are the "common" modules.

#### 2.2.1 Common Module0

[CommonModule0](#) Class. Please note that the class description is shared between **Scriba** and **JSDoc**.
